StreamCaster
WEB VIDEO ON YOUR TV

QUICK START

On your Smart TV in 3 steps.

Samsung or LG: the built-in browser is all it takes. No cable, no app, no extra box.

1

ON THE TV

Open the TV browser, enter the address

Samsung: the “Internet” app. LG: “Web Browser”. A 6-character code and a QR code appear.

`streamcaster.pages.dev/r`

2

ON YOUR PHONE OR PC

Scan the code — or type it

Scan the QR with your phone camera: the page opens and connects by itself. Or type the code and press **Connect**.

`streamcaster.pages.dev`

3

CAST

Paste a link, send a file, or mirror your screen

The TV switches to “Connected” and starts playing. Volume and pause are yours from the phone or the TV remote.

iPhone / iPad: AirPlay is already built into the Smart TV

1. Many Samsung and LG sets (roughly 2019 and later) mirror over AirPlay directly — **no** extra app.
2. On the iPhone: Control Centre → **Screen Mirroring** → pick the TV.
3. You don't need StreamCaster for that — the TV browser still handles links and files.

IF SOMETHING IS STUCK

Typing with the remote is painful
Don't type: scan the QR with your phone camera and it connects instantly.

Page won't load or hangs
Update the TV software. On older sets the browser is too old — use a Fire TV or Chromecast instead.

Video won't start
Some sites block third-party players. Use “Browse & cast” in the sender and play it there.

TV	PHONE / PC	IPHONE (AIRPLAY)
`streamcaster.pages.dev/r`	`streamcaster.pages.dev`	in the TV menu, no app

Tip: the code stays valid while your phone steps away — the TV keeps waiting for the next device.
